widest-line

> Get the visual width of the widest line in a string - the number of columns required to display it

Some Unicode characters are **fullwidth** and use double the normal width. **ANSI escape codes** are stripped and doesn't affect the width.

Useful to be able to know the maximum width a string will take up in the terminal.

Install

```
$ npm install widest-line
```

Usage

```
import widestLine from 'widest-line';

widestLine('古\n\u001B[1m@\u001B[22m');
//=> 2
```
